Belgian optical interface module

Overview

BEI's Optical Isolator Module is a versatile interface between an incremental encoder and receiving electronics. It accepts single ended or differential inputs and provides single ended or differential outputs in either an open collector or line driver configuration. Optical modules typically have an electrical interface on the side that connects to the inside of the system and an optical interface on the side that connects to the outside. Complete portfolio of optical interfaces to satisfy rapidly increasing bandwidth demand in the access part of the network. Various types of transceivers are available for business services, data center, and storage area networks to meet your needs. The modules were plug and play and they performed. Optical modules, also known as fiber optic modules, are electronic devices that convert electrical signals into optical signals, and vice versa. Optical modules come in a variety of form. Telcom is a technical study office with 30 years of experience specializing in fixed and mobile telecommunications networks, including Fiber to the Home (FTTH) and other fiber optic solutions.
