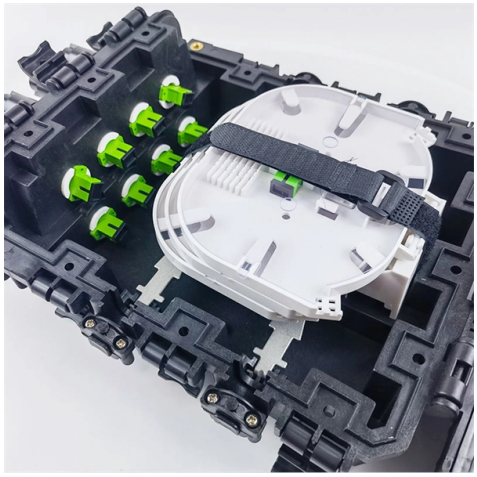
Fiber Optic and Cable Selection



Overview

Understand how to choose fiber optic cable by comparing single-mode vs. multimode, network speed and distance needs, cable jackets/fire ratings, connectors, cost and future-proofing for data and telecom networks. Fiber optic cables are often seen as the gold standard for network cabling. Unlike copper wires, which are limited by lower data transmission speeds, shorter transmission distances, and higher susceptibility to electromagnetic interference, fiber optic cables offer unparalleled performance and can. There are primarily two types of fiber optic cables: single-mode (SMF) and multimode (MMF). Single-mode Fiber (SMF): SMF cables are designed for long-distance communication and have a smaller core diameter, allowing them to carry light directly down the fiber with little attenuation and dispersion. Because the light travels a single, straight path, modal dispersion is eliminated, making SMF the choice for virtually all long-distance applications.
