Plate-type liquid-cooled micro-module data center

Overview

□□Pre-fabricated standardized cabinets with integrated liquid cooling, power distribution, and monitoring, enabling quick deployment and scalability. □□Directly cools heat-generating components like CPUs and GPUs, significantly reducing PUE and enhancing energy efficiency. Molex delivers a scalable cold plate liquid cooling platform including plates, manifolds and sensing technologies designed for simplified maintenance and hybrid air-liquid deployments. Liquid cooling—specifically Direct-to-Chip (D2C) or Cold Plate technology—has emerged as the standard solution for. Cold plates are a way to implement localized cooling of power electronics by transferring heat from the device to a liquid that flows to a remote heat exchanger and dissipates into either the ambient or to another liquid in a secondary cooling system. The internal,mini-channel fin structure. CoolIT's modular design approach and deep liquid-cooling experience enables rapid engineering of high-performance, highly reliable custom solutions. Equipped with state-of-the-art equipment, our LiquidLab™ innovation centers facilitate rapid design, prototyping and testing of next-generation. Cold Plate Liquid Cooling Technology is to operate by directly contacting various processors (high-density heat sources) in IT equipment with liquid cooling plates. The method of cooling the processor is achieved by circulating cooling fluid between the liquid cooling plate and the Cooling.
