LFP Function of Optical Module

Overview

LFP (Link Fault Pass Through) propagates a local link failure to the remote media converter, ensuring faults in copper links are immediately detected at both ends. What is FEF?

FEF (Far End Fault) is a fiber-optic network feature that detects faults at the remote end. Its built-in LFP function provides the critical fault management capability discussed throughout this article, making it a practical embodiment of the theoretical principles in real-world networking. This assembly comprises a light source, such as a laser diode or a semiconductor light-emitting diode (LED), an optical interface, a. LFP refers to Link Fault Pass Through, which can transmit the link fault of the optical transceiver on one side to the optical transceiver on the other side. A media converter is a network device that is widely referenced for optoelectronic conversion, especially for interconnecting.
