Local fiber optic patch cord

Overview

These connectors enable quick connections of fiber optic patch cords to optical switches, telecommunications networks, computer devices, or other fiber optic equipment.

Key Takeaways

A local fiber optic patch cord includes a fiber core, cladding, protective jacket, strength members, and connectors on both ends.

Core and Cladding

At the center of a fiber optic patch cord is the core, made of glass or plastic, which carries light signals. Surrounding the core is the cladding, which reflects light back into the core to maintain signal integrity and prevent loss during transmission. The core size varies depending on the type of fiber: single-mode fibers typically have a 9-micron core for long-distance transmission, while multimode fibers have larger cores (50 or 62.5 microns) for short-range, high-capacity networks.

Strength Members

Between the cladding and the outer jacket are strength members, usually made of aramid yarn (Kevlar). These provide durability and resistance to physical stress without compromising flexibility, helping the patch cord withstand handling and installation conditions.

Protective Jacket

The outer jacket protects the internal fiber and strength members from environmental damage. Jacket materials vary based on installation requirements: PVC for basic indoor use, plenum-rated (OFNP) for fire-resistant air ducts, riser-rated (OFNR) for vertical shafts, and LSZH (Low Smoke Zero Halogen) for high-safety areas. Jacket colors often indicate fiber type or network function, such as yellow for single-mode and aqua or lime green for multimode variants.

Connectors

A fiber optic patch cord has connectors on both ends, which allow it to interface with network devices, patch panels, or transceivers. Common connector types include LC, SC, ST, and MPO/MTP, with simplex (single fiber) or duplex (two fibers) configurations depending on the network design. Connector polishing types, such as UPC or APC, affect signal reflection and insertion loss.

Additional Features

Some patch cords are designed with bend-insensitive fibers (G. 657A1/A2) for tight spaces or FTTH applications. Custom lengths, jacket printing, and color coding can be provided to match local standards and installation environments.

In summary, a local fiber optic patch cord is a carefully assembled cable that includes a fiber core and cladding, strength members, protective jacket, and connectors, designed to ensure reliable, high-speed optical connections within a network.
