Method for winding temperature-sensing optical cables

Overview

For this study, a distributed optical fibre testing method for the temperature of transformer winding based on Raman scattering was investigated, a distributed temperature detection system was designed, and the winding temperature was measured directly by conducting temperature. For this study, a distributed optical fibre testing method for the temperature of transformer winding based on Raman scattering was investigated, a distributed temperature detection system was designed, and the winding temperature was measured directly by conducting temperature. Power transformers are critical components in electrical systems, and accurate temperature monitoring of their windings is essential to ensure reliable operation and prevent overheating. The technology used leverages fiber-optic sensors to provide real-time and accurate temperature measurements. Based on Raman scattering, a new fibre-optic composite winding model was developed. The feasibility of the model was verified by electrical as well as temperature, field simulation and power frequency resistance testing. Why buy?

The data and illustrations are not binding. We reserve the right to modify the contents of this. Winding Hot Spot Temperature refers to the specific area within a transformer that has the highest temperature.

Article Content

Transformer Optical Windings temperature monitoring

Temperature changes induce strain in the fiber, altering the wavelength of reflected light, which correlates with temperature variations. The sensors are embedded in the transformer winding to

Design and Performance Test of Transformer Winding Optical Fibre

A distributed optical fibre sensing technology based on Raman scattering to measure the temperature of transformer windings was proposed, the optical fibre composite winding was

Transformer Winding Temperature Monitoring — OTI, WTI, RTD ...

A winding temperature indicator (WTI) uses a thermal imaging (simulation) method to estimate the winding hot-spot temperature without directly measuring the winding conductor.

DSS0036_FO HSM_EN_A4 Compressed

FOS employs fiber optic cables embedded within the transformer windings. These cables contain sensors that convert temperature variations into changes in the light signal traveling through the fiber.

Design and Performance Test of Transformer Winding

To assess the practicality and accuracy of the new model, a distributed optical fibre temperature measurement platform was built, and a

Influence of Different Laying Methods on Monitoring Transformer

In order to apply distributed optical fibre sensing technology to transformer winding temperature monitoring, the temperature detection of transformer windings

Real-time direct hot spot temperature monitoring

Whether you are managing asset health remotely or on-site, our fiber optic temperature measurement system provides high-precise and fast data abou the direct winding hot spot temperature.

How to monitor the temperature of transformers? How to use fiber

Learn how to monitor transformer winding temperature effectively with fluorescent fiber optic sensors—compare with wireless/infrared/PT100, explore installation methods, standard kits,

Application of Distributed Optical Fiber Temperature Measurement in ...

© 2026 PROMETHEAS OPTICAL - All rights reserved

This paper studies a distributed optical fiber temperature measurement system using smart cables, which combines fiber Bragg grating arrays and multi-core commu

A distributed optical fiber sensor for temperature detection in power ...

In this study, temperature detection in an XLPE insulated 154 kV power cable is performed using a distributed sensing method where the optical fiber itself behaves as a sensor.

A Feasibility Study of Transformer Winding

To solve these problems, we present a transformer winding temperature and strain based on a distributed optical fibre sensing detection

untitled []

In order to address this important requirement, the fiber-optic sensors have been significantly optimized so that direct measurement of winding temperature would become the preferred method to ...

OPTIMUM TRANSFORMER COOLING CONTROL WITH FIBER OPTIC TEMPERATURE

Cooling control of power transformers is traditionally provided by a winding temperature indicator (WTI). These devices typically rely on a measurement of the top-oil temperature and a simulation of the

Temperature Monitoring for 500 kV Oil-Filled Submarine Cable Based

The 500 kV oil-filled ac submarine cables in the networking project of China''s southern coast are large capacity, ultrahigh-voltage cross-sea submarine power cables, which are 31 km long and bundled

Recent Development in Transformer Winding Temperature Determina

Still, direct measurement of winding temperature with fiber optic sensor provides a definitive advantage over a value calculated from uncertain parameters provided by the manufacturer and uncertain

Design and Performance Test of Transformer Winding

Winding model test results show that the transformer winding temperature measurement method based on distributed optical fibre sensing can

Distributed temperature detection of transformer

The local overheating fault of power transformer winding threatens the safe, stable operation of a power system. Conventional winding temperature detection

Design and Performance Test of Transformer Winding

© 2026 PROMETHEAS OPTICAL - All rights reserved

Compared with the existing winding temperature measurement methods, the distributed optical fibre sensing technology can accurately measure the winding
