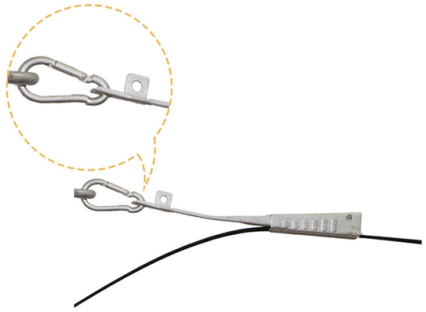
OS2 Fiber Optic Cable Testing



Overview

OS1 vs OS2, OM3 vs OM4 vs OM5 – Fiber Optic Cable Differences Discover the key differences between OS1 and OS2 singlemode fibers, and OM3, OM4, OM5 multimo.

Key Takeaways

OS2 fiber optic cables are tested using Tier 1 and optional Tier 2 methods to verify link performance, insertion loss, polarity, and overall system compliance. Tier 1 Testing (Required)Tier 1 testing is the minimum required for OS2 fiber installations and ensures the system meets design specifications. It includes: Link Attenuation Testing: Measures optical loss using an Optical Loss Test Set (OLTS) or a Light Source and Power Meter (LSPM) at the wavelength the network will operate (commonly 1310 nm or 1550 nm for OS2 single-mode fiber) to verify signal strength.

Link Length Verification: Confirms the physical length of the fiber, either from the cable jacket markings or via OLTS measurement. Polarity Check: Ensures transmit and receive channels are correctly aligned, typically using a Visual Fault Locator (VFL) or during attenuation testing. Testing can be unidirectional (one end) or bidirectional (both ends), with bidirectional testing providing more accurate characterization of the fiber link.

Tier 2 Testing (Optional)Tier 2 testing, often performed with an Optical Time-Domain Reflectometer (OTDR), is optional but highly recommended for: Splice and Connector Loss MeasurementFault Location and TroubleshootingOptical Return Loss (ORL) AssessmentDetailed Documentation of the Fiber Plant OTDR testing complements Tier 1 but does not replace it, as OTDR results can vary depending on launch conditions and fiber characteristics.

Test Equipment and Reference Kits

For OS2 fiber, specialized SN reference test kits are available to simplify testing and ensure compatibility with test equipment. These kits provide: SN Duplex input connectors and SC Simplex or SN Duplex output connectorsQuick visual identification of unused channels for accurate testingCompliance with RoHS material restrictionsCompatibility with OM4/OM5 SN connectivity for reference testing Standards and ComplianceOS2 fiber testing should follow TIA-568.3-D and other relevant ISO/IEC standards. Proper testing ensures: Accurate baseline performance for future troubleshootingVerification that the fiber supports the intended network applicationDocumentation for system certification and customer assurance Best PracticesPerform Tier 1 testing first to establish baseline link performance.

Use bidirectional testing when possible for more precise loss measurements. Document all results for future maintenance and troubleshooting.

Use OTD

R testing for long outside plant cables or when intermediate splices are present. Ensure the correct wavelength is used for testing to match network operation. By following these procedures, OS2 fiber installations can be reliably tested, certified, and maintained for optimal network performance.
