How to interconnect multi-level big data centers

Overview

Multipoint Interconnects: In this architecture, multiple data centers are interconnected in a network, permitting each data center to interact with many others. Hub and Spoke Interconnects: This model includes a central hub data center that links to several “spoke” data. The term DCI (Data Center Interconnect) is relevant in all scenarios where different levels of connectivity are required between two or more data center locations in order to provide flexibility for deploying applications and resiliency schemes. As businesses grow and their need for information increases, connecting data centers has become essential to planning IT infrastructure because it ensures smooth. According to statistics, the compound annual growth rate (CAGR) of global data center traffic from 2016 to 2021 was approximately 23%. Enhance network reach, scalability, and cost-effectiveness. Minimize the size of your network.
